# Optimizing a Discourse Structuring Component for Utterance Generation in Human-Computer Dialogue

Vladimir Popescu, Jean Caelen, Corneliu Burileanu

Constanța, the 18th of June, 2009

# Introduction

Introduction

Rhetorical Structuring

Baseline Discourse  
Structure Updating

Usage of Speech Acts

Limited Dialogue History

Stack of Predicates

Typical Dialogue

Evaluation

Conclusions

- ▶ Context: utterance generation in human-computer dialogue systems
- ▶ Approaches to utterance generation:
  - ▶ rule / grammar-based systems: (i) logic-based; (ii) template-based; (iii) combination
  - ▶ corpus-based: (i) purely stochastic; (ii) data-oriented, grammar-based
- ▶ Utterance generation components involved in dialogue:
  - ▶ surface realization only
  - ▶ surface realization + microplanning
  - ▶ surface realization + microplanning + discourse structuring
- ▶ In focus – a rhetorical structuring component for utterance generation in human-computer dialogue:
  - ▶ first-order logic emulation of a fragment of SDRT
  - ▶ set of language & task-independent discourse predicates
  - ▶ language-independent, domain-specific task ontology
- ▶ Roles of the rhetorical structuring component:
  - ▶ rhetorical structuring of multi-sentential machine dialogue turns
  - ▶ connection of machine dialogue turns to the dialogue history
  - ▶ dealing with certain surface phenomena: (i) connectors & other closed-class words (e.g. free choice items); (ii) anaphora & ellipsis, etc.

# Baseline Rhetorical Structuring Component

Introduction

Rhetorical Structuring

Baseline Discourse  
Structure Updating

Usage of Speech Acts

Limited Dialogue History

Stack of Predicates

Typical Dialogue

Evaluation

Conclusions

- ▶ Usage of SDRT rhetorical relations:
  - ▶ Monologic: Alternation, Background, Consequence, Elaboration, Narration, Contrast, Parallel
  - ▶ Dialogic: Q-Elab, IQAP, P-Corr, P-Elab, Background<sub>q</sub>, Elab<sub>q</sub>, Narration<sub>q</sub>, QAP, ACK, NEI
- ▶ Semantics of rhetorical relations:
  - ▶ Expressed in a first-order logic, using the set of **discourse** predicates
  - ▶ Preservation of Asher & Lascarides' informal statements
- ▶ Examples:
  - ▶ Monologic relation: Background( $\alpha, \beta$ ):
    - ▶ Semantics:  $\beta$  informs on the *a priori* occurrence context of  $\alpha$ ;
    - ▶ Dialogue excerpt ( $M$  denotes the machine):  
 $\alpha$ :  $M$ : I'm lending you this book, 'X'.  
 $\beta$ :  $M$ : You have the right to borrow three books at a time.
  - ▶ Dialogic relation: P-Corr( $\alpha, \beta$ ) (Plan Correction):
    - ▶ Semantics: the emitter of  $\beta$  refutes the plan conveyed by  $\alpha$ ;
    - ▶ Dialogue example ( $U$  denotes the human user):  
 $\alpha$ :  $U$ : Could I have this book for next week?  
 $\beta$ :  $M$ : The book is already reserved by another client from the 16th until the 25th.

# Baseline Discourse Structure Updating Algorithm

Introduction

Rhetorical Structuring

Baseline Discourse Structure Updating

Usage of Speech Acts

Limited Dialogue History

Stack of Predicates

Typical Dialogue

Evaluation

Conclusions

for each utterance  $\alpha$  to be added to the dialogue SDRS:

1. read its corresponding logic form  $K(\alpha)$ , through a query to the *dialogue controller*;
2. for each utterance  $\beta$  already in the dialogue SDRS:
  - 2.1 read its corresponding logic form  $K(\beta)$ ;
  - 2.2 retrieve the set  $P$  of potential rhetorical relations (monologic or dialogic);
  - 2.3 for each rhetorical relation  $\rho$  in set  $P$ :
    - 2.3.1 read the semantics  $\Sigma_\rho$  of rhetorical relation  $\rho$ ;
    - 2.3.2 compute the truth value  $\gamma$  of the proposition  $\Sigma_\rho(K(\alpha), K(\beta))$ ;
    - 2.3.3 if  $\gamma = \text{FALSE}$ , then go to step 2.3; else add  $\rho$  to the set of rhetorical relations in the SDRS and  $\alpha$  to the set of utterances in the SDRS and go to 2.3.

# Baseline Algorithm – Complexity Analysis

Introduction

Rhetorical Structuring

Baseline Discourse  
Structure Updating

Usage of Speech Acts

Limited Dialogue History

Stack of Predicates

Typical Dialogue

Evaluation

Conclusions

## ► Notations:

- $T$  ::= the time needed to prove a rhetorical relation between two utterances
- $N$  ::= the number of utterances in the dialogue
- $M$  ::= the number of speech turns in dialogue
- $R$  ::= the number of possible rhetorical relations between utterances; =  $Rd$  for utterances from different speakers; =  $Rm$  for utterances from the same speaker
- $n$  ::= the index of the current utterance; it varies from 1 to  $N$
- $m$  ::= the index of the current speech turn; it varies from 1 to  $M$
- $v(m)$  ::= the number of utterances in speech turn number  $m$ ; we have that  $\sum_{m=1}^M v(m) = N$  and  $\forall m[v(m) < N - M + 1]$
- $i_m$  ::= the index of the current utterance in speech turn number  $m$ ; there are  $v(m)$  values for  $i_m$
- $\tau_{\text{LAST\_UTT}}$  ::= total running time, for the computation of the rhetorical relations connecting the last utterance to the rhetorical context

## ► Analysis:

$$\tau_{\text{LAST\_UTT}} = T \times [Rm \times \sum_{i_M=1+\sum_{k=1}^{M-1} v(k)}^{\sum_{k=1}^M v(k)} (i_M - 1 + \sum_{i \geq 1, M-2i \geq 1} v(M-2i)) + Rd \times \sum_{i_M=1+\sum_{k=1}^{M-1} v(k)}^{\sum_{k=1}^M v(k)} \sum_{i \geq 0, M-2i \geq 2} v(M-2i-1)] < (N - M + 1) \times T \times Rd \times (3 \cdot N - M - 1) = T \times Rd \times (3 \cdot N^2 - 4 \cdot N \times M + M^2 + 2 \cdot N - 1).$$

Introduction

Rhetorical Structuring

Baseline Discourse  
Structure Updating

Usage of Speech Acts

Limited Dialogue History

Stack of Predicates

Typical Dialogue

Evaluation

Conclusions

## ▶ Notations and approximations:

- ▶  $R(n_1, n_2) ::=$  the number of possible rhetorical relations between utterances number  $n_1$  and number  $n_2$ ; =  $Rd(n_1, n_2)$  for utterances from different speakers; =  $Rm(n_1, n_2)$  for utterances from the same speaker; on average,  $Rd(n_1, n_2) \leq 3$  and  $Rm(n_1, n_2) \leq 3$
- ▶  $\tau_{TOT}^{ACTS} ::=$  total running time, for the computation of the entire structure, with speech acts;
- ▶  $\tau_{LAST\_UTT}^{ACTS} ::=$  total running time, for the computation of the rhetorical relations between the last utterance and the rhetorical context
- ▶  $Rm \mapsto Rm(i_m, i_m - j) : j \in \{1 + \sum_{k=1}^{m-1} v(k), \dots, i_m\} \cup \{2k \text{ such that } i_m - 2k \geq 1\}$
- ▶  $Rd \mapsto Rd(i_m, i_n) : n \neq m \wedge i_m < i_n$
- ▶  $Rm(i_m, i_m - j) \mapsto 3 \wedge Rd(i_m, i_n) \mapsto 3$

## ▶ Analysis:

- ▶  $\tau_{TOT}^{ACTS} \approx \frac{7}{2} \cdot M \times N^2 \times T \times 3 + M^2 \times N \times (2 - 7 \cdot T \times 3) + M^3 \times (\frac{7}{2} \cdot T \times 3 - 2) + M \times N \times (\frac{7}{2} \cdot T \times 3 - 2) + M^2 \times (4 - \frac{7}{2} \cdot T \times 3) - 2 \cdot M$
- ▶  $\tau_{LAST\_UTT}^{ACTS} \approx \frac{1}{6} \cdot \tau_{LAST\_UTT}$

# Second Optimization – Limitation of the Accessible Dialogue History

Introduction

Rhetorical Structuring

Baseline Discourse  
Structure Updating

Usage of Speech Acts

Limited Dialogue History

Stack of Predicates

Typical Dialogue

Evaluation

Conclusions

## ► Assumptions and notations:

- speech acts not used  $\Rightarrow Rm$  candidate rhetorical relations for monologue situations and  $Rd$  candidates for dialogue
- $Q ::=$  the maximum number of prior speech turns or utterances to be rhetorically connected to the current one
- $\tau_{LAST\_TURN}^{LIMITED\_HISTORY} ::=$  total running time, for the computation of the rhetorical relations connecting the utterances in the last speech turn to the rhetorical context, with limited dialogue history

## ► Analysis:

$$\tau_{LAST\_TURN}^{LIMITED\_HISTORY} =$$

$$Rm \times T \times \min \left( \sum_{i_M=1+\sum_{k=1}^{M-1} v(k)}^{\sum_{k=1}^M v(k)} (i_M - 1 + \sum_{i \geq 1, M-2i \geq 1} v(M-2i)), \sum_{i_M=1+\sum_{k=1}^{M-1} v(k)}^{\sum_{k=1}^M v(k)} (i_M - 1 + \sum_{i \geq 1, M-2i \geq M-Q} v(M-2i)) \right) + Rd \times T \times \min \left( \sum_{i_m=1+\sum_{k=1}^{m-1} v(k)}^{\sum_{k=1}^m v(k)} (\sum_{i \geq 0, m-2i \geq 1} v(m-2i-1)), \sum_{i_m=1+\sum_{k=1}^{m-1} v(k)}^{\sum_{k=1}^m v(k)} (\sum_{i \geq 0, m-2i \geq M-Q+1} v(m-2i-1)) \right) \leq Rm \times T \times \sum_{i_M=1+\sum_{k=1}^{M-1} v(k)}^{\sum_{k=1}^M v(k)} (i_M - 1 + \sum_{i \geq 1, 2i \leq Q} v(M-2i)) + Rd \times T \times \sum_{i_m=1+\sum_{k=1}^{m-1} v(k)}^{\sum_{k=1}^m v(k)} (\sum_{i \geq 0, 2i \leq Q-1} v(m-2i-1)) < T \times Rd \times (2 \cdot \sum_{k=M-Q}^{M-1} v(k) + \sum_{k=1}^{M-Q-1} v(k) + \frac{v(M)-1}{2}) \leq T \times Rd \times (-2Q^2 + Q - 1 - 2QM + 2QN + \frac{M+N}{2})$$

# Third Optimization – Stack of Computed Discourse Predicates

Introduction

Rhetorical Structuring

Baseline Discourse  
Structure Updating

Usage of Speech Acts

Limited Dialogue History

Stack of Predicates

Typical Dialogue

Evaluation

Conclusions

- ▶ Key idea: when a discourse predicate applied to an utterance is evaluated, its truth value is stored  $\Rightarrow$  in subsequent uses of the same predicate with the same utterance, the truth value is retrieved (in negligible time), instead of being computed
- ▶ Discourse predicates stored in a **stack**  $\Leftarrow$  predicates applied to more recent utterances are more likely to be used again  $\leftrightarrow$  recency of the available attachment points in discourse structure update

# Stack-based Handling of Discourse Predicates

Introduction

Rhetorical Structuring

Baseline Discourse  
Structure Updating

Usage of Speech Acts

Limited Dialogue History

Stack of Predicates

Typical Dialogue

Evaluation

Conclusions

1. each predicate  $p$  of a rhetorical relation  $\rho$ , applied on the utterance labeled  $\pi$  is computed (e.g.  $\text{topic}(\pi)$ ,  $\text{enounce}(\pi)$ ) and used;
2.  $\rho(\pi)$  along with its truth value, denoted by  $\theta(\rho(\pi))$  is stored in the stack, as a pair  $\rho(\pi) \leftrightarrow \theta(\rho(\pi))$ ;
3. for a subsequent utterance  $\pi'$ , when computing a certain rhetorical relation  $\rho(\pi, \pi')$ :
  - 3.1 if the predicate  $\rho(\pi)$  belongs to the semantics of  $\rho$ , then its truth value is read from the stack and not computed anymore;
  - 3.2 else, the stack is further checked, until either:
    - 3.2.1 a predicate  $p'$  belonging to  $\rho$  and applied to  $\pi'$  is found: in that case  $p'(\pi') \leftrightarrow \theta(p'(\pi'))$  is read from the stack, or
    - 3.2.2 a predicate  $p'$  belonging to  $\rho$  and applied to  $\pi$  is found: in that case,  $p'(\pi) \leftrightarrow \theta(p'(\pi))$  is read from the stack, or
    - 3.2.3 nothing relevant is found in the stack, hence the predicates are computed.

# Stack-based Algorithm – Complexity Analysis

Introduction

Rhetorical Structuring

Baseline Discourse  
Structure Updating

Usage of Speech Acts

Limited Dialogue History

Stack of Predicates

Typical Dialogue

Evaluation

Conclusions

- ▶ Notations and assumptions:
  - ▶  $\tau$  ::= the time needed to compute the truth value of a predicate included in the definition of a rhetorical relation; it is assumed constant for all the predicates
  - ▶  $\pi_{\text{new}}$  ::= a new utterance, due to be attached to the rhetorical structure
  - ▶  $\Pi_{\text{prior}}$  ::= a set of prior utterances, so that  $|\Pi_{\text{prior}}| = N$
  - ▶  $P_{\text{prior}}$  ::= the set of previously used rhetorical relations
  - ▶  $\text{arg}(\rho)$  ::= the set of arguments of rhetorical relation  $\rho$
  - ▶  $\nu(\rho)$  ::= the number of predicates in the definition of rhetorical relation  $\rho$
  - ▶  $\tau_{\text{LAST\_UTT}}^{\text{STACK}}$  ::= the time needed to attach the last utterance to the discourse structure of the dialogue, when the predicate stack is used
  - ▶ conjunctions, disjunctions and negations of predicates are assumed to be computed in a negligible time
- ▶ Analysis:
  - ▶  $\tau_{\text{LAST\_UTT}} = \tau \times \sum_{i=1}^{Rd|Rm} \sum_{\pi \in \Pi_{\text{prior}}} \nu(\rho_i(\pi, \pi_{\text{new}}))$
  - ▶  $\tau_{\text{LAST\_UTT}}^{\text{STACK}} = \tau \times \sum_{i=1}^{Rm|Rd} \sum_{\pi \in \Pi_{\text{prior}}} (\nu(\rho_i(\pi, \pi_{\text{new}})) - |\rho_i \cap (\bigcup_{\rho: \rho \in P_{\text{prior}} \wedge \pi \in \text{arg}(\rho)} \rho)|)$
  - ▶  $\lim_{|\Pi_{\text{prior}}| \rightarrow \infty} (|\rho_i \cap (\bigcup_{\rho: \rho \in P_{\text{prior}} \wedge \pi \in \text{arg}(\rho)} \rho)|) = \nu(\rho_i) \Rightarrow$  for long and *varied* dialogues, the discourse predicate computing time tends to decrease for each rhetorical structure update

# Conclusions and Prospects

Introduction

Rhetorical Structuring

Baseline Discourse  
Structure Updating

Usage of Speech Acts

Limited Dialogue History

Stack of Predicates

Typical Dialogue

Evaluation

Conclusions

- ▶ A series of optimizations brought to a rhetorical structuring component for utterance generation in dialogue systems:
  - ▶ baseline algorithm  $\leftarrow$  quadratic in the size of the dialogue
  - ▶ first optimization  $\leftrightarrow$  speech act usage  $\Rightarrow$  constant reduction of the computation time; the same complexity as the baseline
  - ▶ second optimization  $\leftrightarrow$  limitation of the dialogue history  $\Rightarrow$  complexity reduction: quadratic in the size of the available dialogue history
  - ▶ third optimization  $\leftrightarrow$  stack of previously computed discourse predicates  $\Rightarrow$  complexity reduction: linear in the size of the dialogue
- ▶ The three optimization cascaded  $\Rightarrow$   $> 100 \times$  reduction in the discourse updating time with one turn, for a typical 23-utterance dialogue
- ▶ Perspective: exhaustive evaluations, either via a Wizard-of-Oz experiment, or via a real dialogue system
- ▶ Further prospect: compiling the semantics of the rhetorical relations into abstract attribute grammars (DONE), and embedding them into the updating procedure, for further speedup (TO DO)
